
Introduction to Parsing:
Top-Down vs. Bottom-Up
Structural Ambiguities

Parsing algorithms defined:

- The process of finding a derivation (i. e. sequence of productions) leading from the START symbol to the TERMINAL symbols
 - Shows how a particular sentence *could be* generated by the rules of the grammar
- If sentence is structurally ambiguous, more than one possible derivation is produced
- Can solve both the recognition and analysis problems
 - Is this sentence derived from this grammar?
 - Give the derivation(s) that can derive this sentence.
- **Parsing algorithms give a strategy for finding a derivation** by making choices among the derivation rules and deciding when the derivation is complete or not.

Top-down Parser

- Goal-driven
- At each stage, the parser looks at goal of a non-terminal symbol (starting with S) and then sees which rules can be applied
 - Typically progresses from top-to-bottom, left-to-right
 - Non-deterministic (can be rewritten in more than one way)
- When rules derive lexical elements (words), check with the input to see if the right sentence is being derived
- An algorithm may include a backtracking mechanism
 - When it is determined that the wrong rule has been used, it backs up and tries another rule

Example Grammar

- The flight grammar from the text has multiple rules for S:

$S \rightarrow NP VP$

$S \rightarrow Aux NP VP$

$S \rightarrow VP$

$NP \rightarrow Pronoun$

$NP \rightarrow Proper-Noun$

$NP \rightarrow Det Nominal$

$Nominal \rightarrow Noun$

$Nominal \rightarrow Nominal Noun$

$Nominal \rightarrow Nominal PP$

$VP \rightarrow Verb$

$VP \rightarrow Verb NP$

$VP \rightarrow Verb NP PP$

$VP \rightarrow Verb PP$

$VP \rightarrow VP PP$

$PP \rightarrow Preposition NP$

$Det \rightarrow that \mid this \mid a$

$Noun \rightarrow book \mid flight \mid meal \mid money$

$Verb \rightarrow book \mid include \mid prefer$

$Pronoun \rightarrow I \mid she \mid me$

$Proper-Noun \rightarrow Houston \mid TWA$

$Aux \rightarrow does$

$Preposition \rightarrow from \mid to \mid on \mid near \mid through$

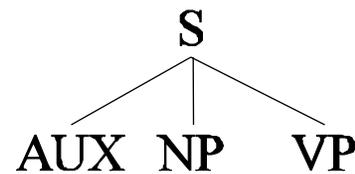

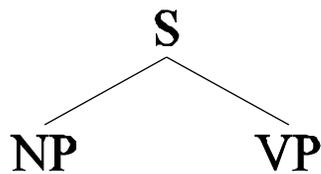

Example Derivation

- Derivation for “Book that flight” (from the text)

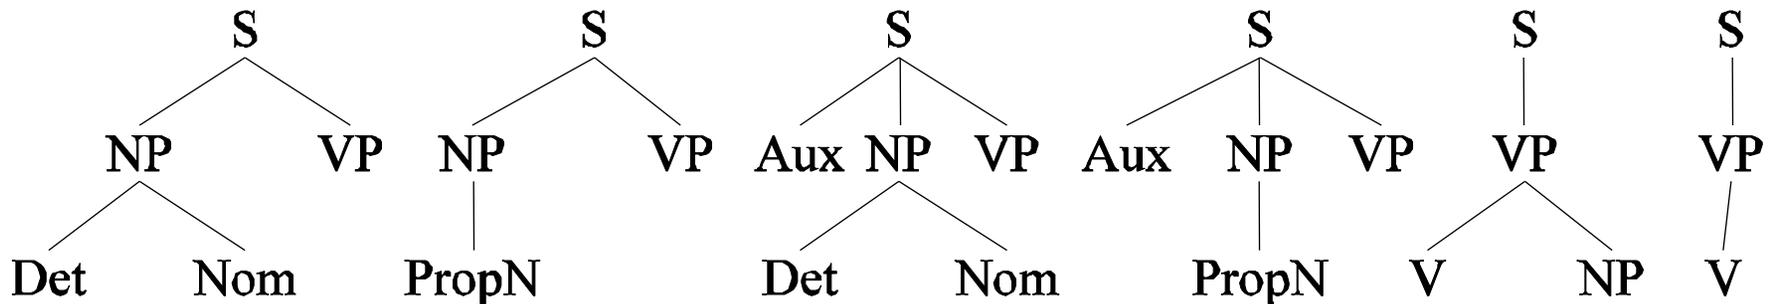

- The Start symbol

S

- Can derive 3 rules as follows:

- Each non-terminal can derive additional rules

- Only the last two trees can derive the word “book” as first in the input

Top-down Parsing Demo

- NLTK parsing demos
 - Top-down parsing using a recursive descent algorithm
 - Top down parsing with back-tracking
 - Must not have left-recursion in the grammar rules

`nltk.app.rdparsers()`

- Described in NLTK book, Chapter 8, Analyzing Sentence Structure

Bottom-up Parser

- Data-driven
- Looks at words in input string first, checks / assigns their category(ies), and tries to combine them into acceptable structures in the grammar
- Involves scanning the derivation so far for sub-strings which match the right-hand-side of grammar / production rules and using the rule that would show their derivation from the non-terminal symbol of that rule

Bottom-up Derivation

- Starts with input text

Book that flight

- derive the text from rules, in this case, two possible lexical rules

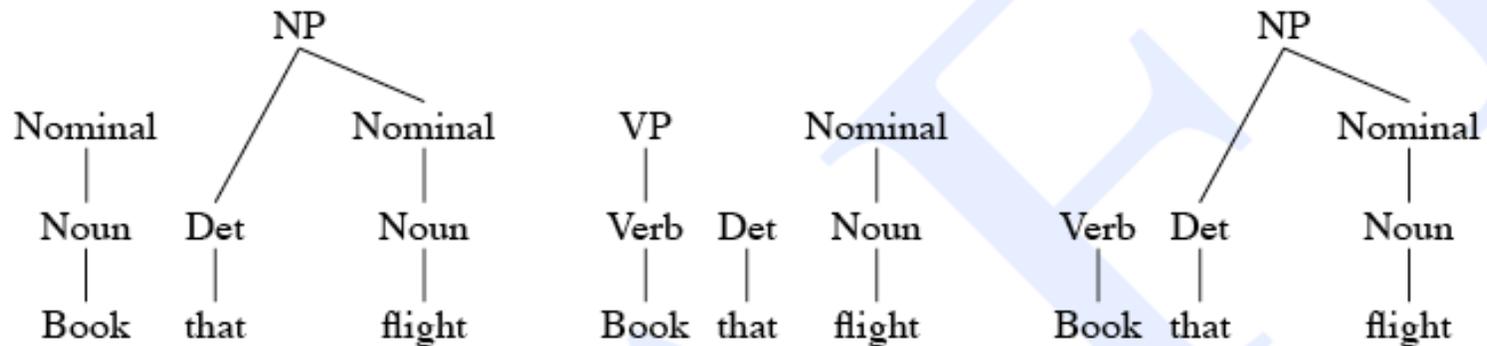

Noun	Det	Noun	Verb	Det	Noun
Book	that	flight	Book	that	flight

- Each of those can be derived from nonterminals

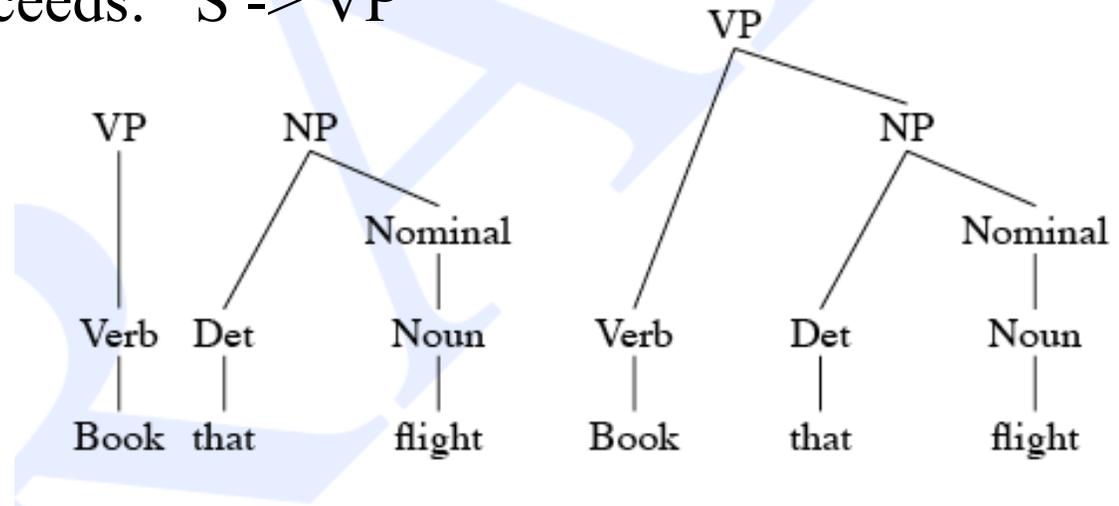

Nominal		Nominal			Nominal
Noun	Det	Noun	Verb	Det	Noun
Book	that	flight	Book	that	flight

Bottom-Up Derivation

- Only the rightmost tree can continue the derivation here:

- And only one succeeds: $S \rightarrow VP$

Bottom-up Parsing

- Algorithm called shift/reduce parsing
 - Scans the input from left to right and keeps a “stack” of the partial parse tree so far
 - Chooses shift or reduce operations
 - The shift operation looks at the next input and shifts it onto the stack
 - The reduce operation looks at N symbols on the stack and if they match the RHS of a grammar rule, reduces the stack by replacing those symbols with the nonterminal
- Also must either incorporate back-tracking or must keep multiple possible parses

Bottom-up Parsing Demo

- NLTK parsing demos
 - Bottom-up parsing using a shift-reduce algorithm
 - Instead of back-tracking or multiple parses, this NLTK implementation requires outside intervention to apply the correct rule when there is a choice

`nltk.app.srparser()`

- Described in NLTK book, Chapter 8, Analyzing Sentence Structure

Parsing issues

- Top-down
 - Only searches for trees that can be answers (i.e. S's)
 - But also suggests trees that are not consistent with any of the words
- Bottom-up
 - Only forms trees consistent with the words
 - But suggest trees that make no sense globally
- Note that in the “book that flight” example, there was local ambiguity between “book” being a verb or a noun that was resolved at the end of the parse
- But examples with structural ambiguity will not be resolved, resulting in more than one possible derivation

Structural Ambiguity

- *One morning I shot an elephant in my pajamas. How he got into my pajamas I don't know.* Groucho Marx, *Animal Crackers*, 1930.
